User interface switched from `FLTK` to `Qt`

Modification history

- 18-12-2014 Guus : creation

Problem definition

During our first attempts at user interface definition the team felt that using `FLTK` put us at a disadvantage compared to a more complete user interface toolkit like `Qt`.

Conclusion

We switch to `Qt` for the user interface toolkit.

Motivation

The top 4 user interface toolkits all satisfy the main requirements for selection. The choice made was done on the basis of `mean and lean`, while during development we felt ease of development was preferable. For that reason we chose `Qt`.
